

1. Let $f: \mathbb{R} \rightarrow \mathbb{R}$ be defined as $f(x) = 10x + 7$. Find the function $g: \mathbb{R} \rightarrow \mathbb{R}$ such that $g \circ f = f \circ g = \text{IR}$.

SOLUTION

$f: X \rightarrow Y$, where $X, Y \subseteq \mathbb{R}$. Let $y \in Y$, arbitrarily.

By definition, $y = 10x + 7$ for $x \in X$

$$\Rightarrow x = \frac{y-7}{10}$$

We define, $g: Y \rightarrow X$ by $g(y) = \frac{y-7}{10}$

$$\text{Now, } (g \circ f)(x) = g(f(x)) = \frac{f(x)-7}{10} = \frac{(10x+7)-7}{10} = x$$

$$\text{and } (f \circ g)(y) = f(g(y)) = 10g(y) + 7 = 10\left(\frac{y-7}{10}\right) + 7 = y$$

Thus, $g \circ f = f \circ g = \text{IR}$.

Hence, f is invertible and $g: Y \rightarrow X$ such that $g(y) = \frac{y-7}{10}$

2. Let $f: \mathbb{W} \rightarrow \mathbb{W}$ be defined as $f(n) = n-1$, if n is odd and $f(n) = n+1$, if n is even. Show that f is invertible. Find the inverse of f . Here, \mathbb{W} is the set of all whole numbers.

SOLUTION

$f: \mathbb{W} \rightarrow \mathbb{W}$

$$f(n) = \begin{cases} n-1, & \text{if } n \text{ is odd} \\ n+1, & \text{if } n \text{ is even} \end{cases}$$

Injectivity

Let n, m be any two odd real whole numbers.

$$\therefore f(n) = f(m) \Rightarrow n-1 = m-1 \Rightarrow n = m$$

Again, let n, m be any two even whole numbers.

$$\therefore f(n) = f(m) \Rightarrow n+1 = m+1 \Rightarrow n = m$$

If n is even and m is odd, then $n \neq m$.

Also, if $f(n)$ is odd and $f(m)$ is even, then $f(n) \neq f(m)$

Thus, if $n \neq m \Rightarrow f(n) \neq f(m)$. $\therefore f$ is an injective.

Surjectivity :

Let n be an arbitrary whole number.

If n is an odd number, then there exists an even whole number

$$(n+1) \text{ such that } f(n+1) = n+1-1 = n$$

If n is an even number, then there exists an odd whole number,

$$\text{such that } f(n-1) = (n-1) + 1 = n$$

Thus, every $n \in \mathbb{W}$ has its pre-image in \mathbb{W} .

So, $f: \mathbb{W} \rightarrow \mathbb{W}$ is a surjective.

Thus, f is invertible and f^{-1} exists.

Now, $f(n-1) = n$, if n is odd and $f(n+1) = n$, if n is even.

$$\Rightarrow n-1 = f^{-1}(n), \text{ if } n \text{ is odd and } n+1 = f^{-1}(n), \text{ if } n \text{ is even.}$$

$$\text{Hence, } f^{-1}(n) = \begin{cases} n-1, & \text{if } n \text{ is odd} \\ n+1, & \text{if } n \text{ is even} \end{cases} . \text{ Hence, } f^{-1} = f$$

3. If $f : \mathbb{R} \rightarrow \mathbb{R}$ is defined by $f(x) = x^2 - 3x + 2$, find $f(f(x))$.

SOLUTION

We are given that, $f(x) = x^2 - 3x + 2$

$$\therefore f[f(x)] = f(x^2 - 3x + 2) = (x^2 - 3x + 2)^2 - 3(x^2 - 3x + 2) + 2$$

$$\Rightarrow f[f(x)] = (x^2 - 3x + 2)^2 - 3(x^2 - 3x + 2) + 2$$

$$= x^4 + 9x^2 + 4 - 6x^3 - 12x + 4x^2 - 3x^2 + 9x - 6 + 2$$

$$= x^4 - 6x^3 + 10x^2 - 3x.$$

$$\text{Hence, } f(f(x)) = x^4 - 6x^3 + 10x^2 - 3x.$$

4. Show that the function $f : \mathbb{R} \rightarrow \{x \in \mathbb{R} : -1 < x < 1\}$ defined by $f(x) = \frac{x}{1+|x|}$, $x \in \mathbb{R}$ is one-one and onto function.

SOLUTION

$$\text{We have : } f(x) = \frac{x}{1+|x|} = \begin{cases} \frac{x}{1+x}, & \text{if } x \geq 0 \\ \frac{x}{1-x}, & \text{if } x < 0 \end{cases}$$

Here, Domain of $f = \mathbb{R}$

To prove : f is one-one Let $x, y \in \text{Domain of } f = \mathbb{R}$, such that $x \neq y$ Here, four cases arise.

Case I : When $x \geq 0, y \geq 0$

$$\text{If } x \neq y \Rightarrow 1+x \neq 1+y \Rightarrow \frac{1}{1+x} \neq \frac{1}{1+y} \Rightarrow \frac{1}{1+x} \neq \frac{-1}{1+y}$$

$$\Rightarrow 1 - \frac{1}{1+x} \neq 1 - \frac{1}{1+y} \Rightarrow \frac{x}{1+x} \neq \frac{y}{1+y}$$

$$\Rightarrow f(x) \neq f(y).$$

Case II : When $x \geq 0$ and $y < 0$ Then, $f(x) = \frac{x}{1+x} \geq 0$ and $f(y) = \frac{y}{1-y} < 0$

$$\Rightarrow f(x) \neq f(y).$$

Case III : When $x < 0$ and $y \geq 0$

Then, $f(x) < 0$ and $f(y) \geq 0$ [As in Case II]

$$\Rightarrow f(x) \neq f(y)$$

Case IV : When $x \leq 0$ and $y \leq 0$

$$\text{If } x \neq y \Rightarrow -x \neq -y \Rightarrow 1-x \neq 1-y \Rightarrow \frac{1}{1-x} \neq \frac{1}{1-y}$$

$$\Rightarrow \frac{1}{1-x} - 1 \neq \frac{1}{1-y} - 1 \Rightarrow \frac{x}{1-x} \neq \frac{y}{1-y} \Rightarrow f(x) \neq f(y).$$

Thus, in each case, $x \neq y \Rightarrow f(x) \neq f(y)$.

Hence, f is one-one.

To prove : f is onto

Let $y \in \mathbb{R}$, where y is arbitrary.

$$\text{Then, } y = f(x) = \frac{x}{1+|x|} = \begin{cases} \frac{x}{1+x} < 1, & \text{if } x \geq 0 \\ \frac{x}{1-x} > -1, & \text{if } x \leq 0 \end{cases}$$

Case I When $y = \frac{x}{1+x}$, where $y \geq 0$

$$y + xy = x \text{ or } y = x(1-y) \text{ or } x = \frac{y}{1-y} \geq 0$$

Case II When $y = \frac{x}{1+x}$, where $y < 0$

$$y - xy = x \text{ or } y = x + xy \text{ or } x = \frac{y}{1+y} < 0$$

Thus, when $y \geq 0$, there is $\frac{y}{1-y} \in \text{Domain of } f = \mathbb{R}$ such that

$$f\left(\frac{y}{1-y}\right) = \frac{\frac{y}{1-y}}{1 + \frac{y}{1-y}} = \frac{y}{1-y+y} = \frac{y}{1} = y$$

and when $y < 0$, there is $\frac{y}{1+y} \in \text{Domain of } f = \mathbb{R}$ such that $f\left(\frac{y}{1+y}\right) = \frac{\frac{y}{1+y}}{1 - \frac{y}{1+y}} = \frac{y}{1+y-y}$

$$= \frac{y}{1} = y$$

Hence, f is onto.

5. Show that the function $f : \mathbb{R} \rightarrow \mathbb{R}$ given by $f(x) = x^3$ is injective.

SOLUTION

Let $x_1, x_2 \in \mathbb{R}$ be such that,

$$f(x_1) = f(x_2) \Rightarrow x_1^3 = x_2^3 \Rightarrow x_1 = x_2$$

$\therefore f$ is one-one. Hence, $f(x) = x^3$ is injective.

6. Give example of two functions $f : \mathbb{N} \rightarrow \mathbb{Z}$ and $g : \mathbb{Z} \rightarrow \mathbb{Z}$ such that gof is injective but g is not injective.

(Hint : Consider $f(x) = x$ and $g(x) = |x|$)

SOLUTION

$f : \mathbb{N} \rightarrow \mathbb{N}$ and $g : \mathbb{Z} \rightarrow \mathbb{Z}$

Let $f(x) = x$ and $g(x) = |x|$. Since, $g(x) = g(-x) = |x| \forall x \in \mathbb{Z}$

$\therefore g$ is not one-one $\Rightarrow g$ is not injective.

Since, $f : \mathbb{N} \rightarrow \mathbb{Z}$ and $g : \mathbb{Z} \rightarrow \mathbb{Z} \Rightarrow \text{gof} : \mathbb{N} \rightarrow \mathbb{Z}$. Let $x_1, x_2 \in \mathbb{N}$.

Now, $(\text{gof})(x_1) = (\text{gof})(x_2) \Rightarrow g(x_1) = g(x_2)|x_1| = |x_2|$

$$\Rightarrow x_1 = x_2 \quad [0]$$

$\therefore \text{gof}$ is one-one. Hence, gof is injective.

7. Give example of two functions $f : \mathbb{N} \rightarrow \mathbb{N}$ and $g : \mathbb{N} \rightarrow \mathbb{N}$ such that gof is onto but f is not onto.

(Hint : Consider $f(x) = x + 1$ and $g(x) = \begin{cases} x-1, & \text{if } x > 1 \\ 1, & \text{if } x = 1 \end{cases}$)

SOLUTION

Consider, $f(x) = x + 1$ and $g(x) = \begin{cases} x-1, & \text{if } x > 1 \\ 1, & \text{if } x = 1 \end{cases}$

$$f(x) = x + 1 \geq 1 + 1 \forall x \in \mathbb{N} \Rightarrow f(x) \geq 2 \forall x \in \mathbb{N}.$$

Clearly, range of $f \neq \mathbb{N}$ [$1 \notin \text{Range of } f$]

$\therefore f$ is not onto.

Now, $(\text{gof}) : \mathbb{N} \rightarrow \mathbb{N}$ such that $(\text{gof})(x) = g(f(x)) = g(x+1) = (x+1)-1$ [$x+1 > 1$ for all $x \in \mathbb{N}$] $= x \forall x \in \mathbb{N}$

$\therefore \text{Range of } (\text{gof}) = \mathbb{N}$ [gof is identity function] Hence, gof is onto.

8. Given a non empty set X , consider $P(X)$ which is the set of all subsets of X . Define the relation R in $P(X)$ as follows : For subsets A, B in $P(X)$, $A R B$ if and only if $A \subset B$. Is R an equivalence relations on $P(X)$? Justify your answer.

SOLUTION

Relations & Functions

(i) Since $A \subset A \forall A \in P(X) \Rightarrow ARA$

$\therefore R$ is reflexive.

(ii) Let $ARB \Rightarrow A \subset B$ and $BRA \Rightarrow B \subset A$

$\Rightarrow A = B$ (which is not so) $[\Rightarrow ARB \not\Rightarrow BRA \Rightarrow R$ is not symmetric

(iii) $ARB, BRC \Rightarrow A \subset B, B \subset C \Rightarrow A \subset C \Rightarrow ARC \Rightarrow R$ is transitive

Thus R is not an equivalence relation of $P(X)$.

9. Given a non-empty set X , consider the binary operation $*$: $P(X) \times P(X) \rightarrow P(X)$ given by $A * B = A \cap B \forall A, B$ in $P(X)$, where $P(X)$ is the power set of X . Show that X is the identity element for this operation and X is the only invertible element in $P(X)$ with respect to the operation $*$.

SOLUTION

(i) Let $E \in P(X)$ be the identity element.

Then, $A * E = E * A = A \forall A \in P(X)$

$\Rightarrow A \cap E = E \cap A = A \forall A \in P(X)$

$\Rightarrow X \cap E = X$ because $X \in P(X) \Rightarrow X \subset E$.

Also, Thus, $E = X$. Hence, X is the identity element.

(ii) Let $A \in P(X)$ be invertible. Then, there exists $B \in P(X)$ such that $A * B = B * A = X$, where X is the identity element.

$\Rightarrow A \cap B = B \cap A = X \Rightarrow X \subset A, X \subset B$ Also, A, B

$\therefore A = X = B$.

Hence, X is the only invertible element and $A^{-1} = B = X$.

10. Find the number of all onto functions from the set $\{1, 2, 3, \dots, n\}$ to itself.

SOLUTION

The number of onto functions that can be defined from a finite set X containing n elements on to a finite set Y containing n elements.

Let $X : \{1, 2, \dots, n\}$ and $Y : \{1, 2, 3, \dots, n\}$

One of the elements of set X (say 1) has any one of the pre-image 1, 2, ..., n i.e. n ways.

In similar way, the element (say 2) in $(n-1)$ ways

\therefore Total number of possible ways = $n(n-1)(n-2) \dots 3.2.1$

= $n!$

11. Let $S = \{a, b, c\}$ and $T = \{1, 2, 3\}$. Find F^{-1} of the following functions F from S to T , if it exists.

(i) $F = \{(a, 3), (b, 2), (c, 1)\}$

(ii) $F = \{(a, 2), (b, 1), (c, 1)\}$

SOLUTION

Given, $S = \{a, b, c\}$ and $T = \{1, 2, 3\}$. (i) $F = \{(a, 3), (b, 2), (c, 1)\}$

i.e. $F(a) = 3, F(b) = 2, F(c) = 1$

$\Rightarrow F^{-1}(3) = a, F^{-1}(2) = b, F^{-1}(1) = c$

$\therefore F^{-1} = \{(3, a), (2, b), (1, c)\}$

(ii) $F = \{(a, 2), (b, 1), (c, 1)\}$

F is not one-one function, since element b and c have the same image 1, so F^{-1} does not exist.

12. Consider the binary operations $*$: $R \times R \rightarrow R$ and \circ : $R \times R \rightarrow R$ defined as $a * b = |a - b|$ and $a \circ b = a, \forall a, b \in R$. Show that $*$ is commutative but not associative and \circ is associative but not commutative. Further, show that $\forall a, b, c \in R, a * (b \circ c) = (a * b) \circ (a * c)$. (If it is so, we say that the operation $*$ distributes over the operation \circ). Does \circ distribute over $*$? Justify your answer.

SOLUTION

For commutativity :

$a * b = |a - b|$ and $b * a = |b - a| = |a - b|$

$$\therefore a * b = b * a$$

Thus, the operation $*$ is commutative.

For associativity

$$\text{Consider, } a * (b * c) = a * |b - c| = |a - |b - c||$$

$$\text{Also } (a * b) * c = |a - b| * c = ||a - b| - c|$$

$$\therefore a * (b * c) \neq (a * b) * c$$

Thus, the operation $*$ is not associative.

For commutativity

$$aob = a \quad \forall a, b \in \mathbb{R}. \text{ Now, } boa = b \Rightarrow aob \neq boa$$

Thus, operation o is not commutative.

For associativity

$$ao(boc) = aob = a \text{ and } (aob)oc = aoc = a$$

$ao(boc) = (aob)oc$. Thus, operation o is associative.

$$\text{To prove : } a * (boc) = (a * b) o (a * c)$$

$$\text{L.H.S.} = a * (boc) = a * b = |a - b|$$

$$\text{R.H.S.} = (a * b) o (a * c) = |a - b| o |a - c| = |a - b|$$

Thus, $a * (boc) = (a * b) o (a * c)$. Hence proved.

Another distributive law

$$ao(b * c) = (aob) * (aoc)$$

$$\text{L.H.S.} = ao(b * c) = ao(|b - c|) = a$$

$$\text{R.H.S.} = (aob) * (aoc) = a * a = |a - a| = 0.$$

As, L.H.S. \neq R.H.S. Hence, the operation o does not distribute over $*$.

13. Given a non-empty set X , let $*$: $P(X) \times P(X) \rightarrow P(X)$ be defined as $A * B = (A - B) \cup (B - A)$, $\forall A, B \in P(X)$. Show that the empty set ϕ is the identity for the operation $*$ and all the elements A of $P(X)$ are invertible with $A^{-1} = A$.

(Hint : $(A - \phi) \cup (\phi - A) = A$ and $(A - A) \cup (A - A) = A * A = \phi$).

SOLUTION

To show : ϕ is the identity

For every $A \in P(X)$, we have

$$\phi * A = (\phi - A) \cup (A - \phi) = \phi \cup A = A$$

$$\text{and } A * \phi = (A - \phi) \cup (\phi - A) = A \cup \phi = A$$

$\Rightarrow \phi$ is the identity element for the operation $*$ on $P(X)$.

$$\text{Also, } A * A = (A - A) \cup (A - A) = \phi \cup \phi = \phi$$

\Rightarrow Every element A of $P(X)$ is invertible with $A^{-1} = A$

14. Define a binary operation $*$ on the set $0, 1, 2, 3, 4, 5$ as $a * b = \begin{cases} a + b, & \text{if } a + b < 6 \\ a + b - 6, & \text{if } a + b \geq 6 \end{cases}$

Show that zero is the identity for this operation and each element $a \neq 0$ of the set is invertible with $6 - a$ being the inverse of a .

SOLUTION

For identity

If e be the identity element, then $a * e = e * a = a$

$$\text{Now, } a * 0 = a + 0 = a \text{ and } 0 * a = 0 + a = a$$

Thus, $a * 0 = 0 * a = a$. Hence, 0 is the identity element of the operation.

For inverse

If b be the inverse of a . then $a * b = b * a = e$.

$$\text{Now } a * (6 - a) = a + (6 - a) - 6 = 0$$

$$\text{and } (6 - a) * a = (6 - a) + a - 6 = 0.$$

Hence, each element a of the set is invertible with inverse $6 - a$.

Relations & Functions

15. Let $A = \{-1, 0, 1, 2\}$, $B = \{-4, -2, 0, 2\}$ and $f, g : A \rightarrow B$ be function defined by $f(x) = x^2 - x, x \in A$ and $g(x) = 2\left|x - \frac{1}{2}\right| - 1, x \in A$.

Are f and g equal ? Justify your answer.

(Hint : One may note that two functions $f : A \rightarrow B$ and $g : A \rightarrow B$ such that $f(a) = g(a) \forall a \in A$, are called equal functions).

SOLUTION

When $x = -1$, $f(-1) = 1 - (-1) = 2$

$$\text{and } g(-1) = 2\left|-1 - \frac{1}{2}\right| - 1 = 2$$

$$\text{When } x = 0, f(0) = 0 \text{ and } g(0) = 2\left|-\frac{1}{2}\right| - 1 = 2 \times \frac{1}{2} - 1 = 0$$

When $x = 1$, $f(1) = 1^2 - 1 = 0$

$$\text{and } g(1) = 2\left|1 - \frac{1}{2}\right| - 1 = 2 \times \frac{1}{2} - 1 = 0$$

$$\text{When } x = 2, f(2) = 2^2 - 2 = 2 \text{ and } g(2) = 2\left|2 - \frac{1}{2}\right| - 1 = 3 - 1 = 2$$

Thus, for each $a \in A$, $f(a) = g(a)$. Hence, f and g are equal functions.

16. Let $A = \{1, 2, 3\}$. Then number of relations containing $(1, 2)$ and $(1, 3)$, which are reflexive and symmetric but not transitive is

- (A) 1
(B) 2
(C) 3
(D) 4

SOLUTION

(A) There is only one relation containing $(1, 2)$ and $(1, 3)$ which is reflexive and symmetric but not transitive.

17. Let $A = \{1, 2, 3\}$. Then number of equivalence relations containing $(1, 2)$ is

- (A) 1
(B) 2
(C) 3
(D) 4

SOLUTION

(B) : There are two equivalence relations containing $(1, 2)$.

18. Let $f : \mathbb{R} \rightarrow \mathbb{R}$ be the Signum Function defined as $f(x) = \begin{cases} 1, & x > 0 \\ 0, & x = 0 \\ -1, & x < 0 \end{cases}$ and $g : \mathbb{R} \rightarrow \mathbb{R}$ be the Greatest Integer

Function given by $g(x) = [x]$, where $[x]$ is greatest integer less than or equal to x . Then, does $f \circ g$ and $g \circ f$ coincide in $(0, 1]$?

SOLUTION

For $x \in (0, 1]$

$$\begin{aligned} (f \circ g)(x) &= f(g(x)) = f([x]) \\ &= \begin{cases} f(0), & \text{if } 0 < x < 1 \\ f(1), & \text{if } x = 1 \end{cases} = \begin{cases} 0, & \text{if } 0 < x < 1 \\ 1, & \text{if } x = 1 \end{cases} \dots (1) \end{aligned}$$

And $(g \circ f)(x) = g(f(x)) = g(1) = [1] = 1$

$$\Rightarrow (g \circ f)(x) = 1 \forall x \in (0, 1] \dots (2)$$

From (1) and (2), $(f \circ g)$ and $(g \circ f)$ do not coincide in $(0, 1]$.

19. Number of binary operations on the set $\{a, b\}$ are

- (A) 10
- (B) 16
- (C) 20
- (D) 8

SOLUTION

(B) There are two elements in the set $\{a, b\}$. \therefore Number of binary operations = $2^4 = 16$.
